

LED Curtain

Each of our hi-tech LED curtains is designed with RGB (Red Green Blue) LEDs that, when equipped with our Smart controller, can produce 16 different light patterns from built-in programming (See examples on this page) or can be combined with a SD card, master controller that has been programmed by a computer to produce various color graphics.

The result is a dazzling array of vivid colors that provide for a sophisticated display in restaurants, lounges, shopping malls, office buildings and even at home.

The size of the LED curtain can be customized to the available space that needs to be filled. Most typically a LED curtain is used to divide areas of

seating which provides visibility from all directions.

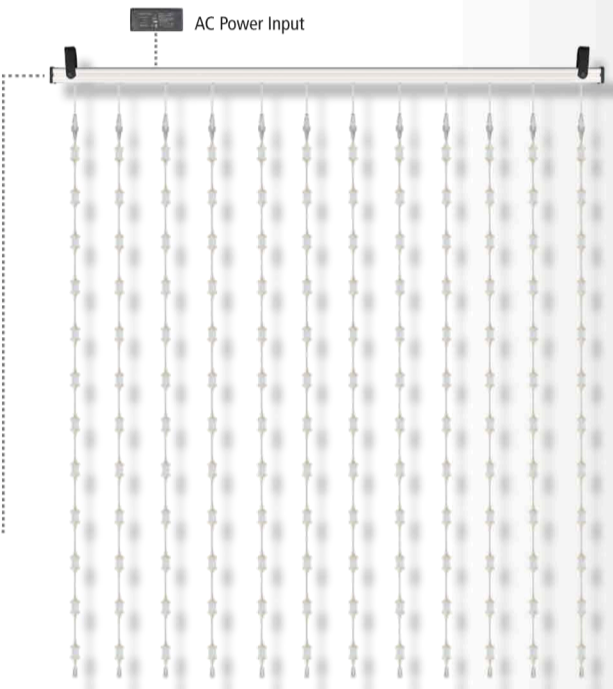

The LED curtain can also be used as a solid or multi-colored backdrop in a variety of settings.

Our LED curtains make an attractive screen during the daytime and come to life in a full color display when evening arrives.

Allow JAS Lighting to bring a new level of excitement to your business or home by installing one of our custom designed, LED curtain systems.
